

Crested Gecko Care Sheet

PROFILE

Common Name: **Crested Gecko**

Latin Name: ***Correlophus Ciliatus***

Native To: **New Caledonia**

Size: **6" - 8"**

Life Span: **15+ years**

HOUSING REQUIREMENTS

Environment:

Humid sub-tropical forest with lots of leaves and branches

Vivarium Size:

Crested Geckos spend the vast majority of their time up in trees. Due to this arboreal nature they will benefit from a vivarium which provides more height than width.

We recommend a vivarium size of at least 12" x 12" x 18" for a single adult specimen, whereas a pair or trio (containing only one male) would suit a 24" x 12" x 24" vivarium or larger

Substrate:

We recommend a number of substrates including orchid bark, forest floor, forest bed, plantation soil and crested life. Crested geckos would also benefit from a bioactive substrate that would support live plants. This method would increase enrichment and sustain humidity levels.

Food and Water:

In the wild crested geckos dine on a mixture of insects and fruit. This can be replicated in captivity by feeding crickets, waxworms, hoppers and mashed fruit. Crested geckos will also eat a product called Repashy. Repashy (and similar foods) is a prepared powdered diet that contains all of the vitamins, minerals and nutrients necessary for a healthy diet.

Crested Geckos may occasionally drink from bowls of water, but they much prefer to drink droplets from leaves and logs. Due to this we recommend regular misting of the vivarium. This will also help to raise the humidity; a vital requirement for Crested Geckos. The ideal humidity for your new pet is 70 – 80%. This can be measured using a hydrometer. If you have trouble keeping the humidity up in the vivarium a waterfall and mister can be added to help, as the constant flow of water will aid evaporation, as well as enticing the gecko to quench its thirst.

Heat/Light Requirements:

Unlike the vast majority of reptiles in captivity in the UK, Crested Geckos do not 'need' additional heat provided your house does not become too cold at night.

Crested Geckos often suffer when exposed to temperatures above 26°C.

Crested Geckos are predominantly nocturnal. Due to this UV lighting is not essential, as it is for many other reptiles. However, Crested Geckos will benefit from a regular photo period of 10 – 12 hours per day.

Day: 22 - 25°C

Night: 18 - 22°C

Please note that this care sheet is only for your basic husbandry knowledge and that it is always recommended that you do further reading.
